New recombinant adenoviruses, useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E, or tumor antigens.

Claim 21; Page 81; 156pp; English.

This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparastic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against

```
infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaxia. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain BH10 antigen construct described in the disclosure of the

Wang D;

WPI; 2003-851718/79

Enhancing the immunity of a host to infection of a first and second pathogenic virus, e.g. influenza, hepatitis, respiratory syncytial, or HIV infections comprises administering to the host a first and a second recombinant ademovirus.

Example; SEQ ID NO 74; 185pp; English.

The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HTV infections. The present sequence is used in the exemplification of the invention.

The vectors are for the expression and secretion of foreign optodeins in an insect cell. The vectors comprise a baculovirus promoter operably linked to an insect virus signal peptide coding region from a baculovirus protein. The signal peptide is either the baculovirus protein of signal peptide is either the baculovirus protein of the Autographa californica muclear polyhedrosis virus (AcNNPV) egt gene. The baculovirus vectors can be used to generate recombinant virus for protein expression in Sf9 cells in a back type system. The vectors allow for the production of proteins that are glycosylated and secreted in the late term of infection, when the promoter is most active.
                                                                                                                                                                                                                                                                                                                                                   Baculovirus vector; p67 signal sequence; insect cell; promoter; egt gene; insect virus; Autographa californica nuclear polyhedrosis virus; AcMNPV; Sf9 cell; glycosylated protein production; HIV-1 gpl20; envelope protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The HIV-1 strain IIIB gp160 gene was inserted into VIJns, a vector contg. a CMVintA-BGH terminator construct (AATOIII2) that allows controlled expression of heterologous genes. The sequences across the 5' junction of CMVintA (cytomegalovirus promoter and intron A) and the HIV gene, and across the 3' junction of the HIV gene and BGH (bovine growth hormone) terminator are given in AATOIO88-89. The vector allows large-scale prodn. of polynucleotide vaccine in bacterial host cells
                                                                                                                9
                                                                                                                                     69
The glycosylated proteins are produced at a much higher level than in previous systems. These vectors can be used to produce HIV-1 gpl20, and other envelope proteins. (Updated on 25-MAR-2003 to correct PF field.)

Human T-cell lymphotrophic virus type III - useful for detection of human T-cell lymphotrophic virus type III antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The polypeptides it encodes are useful for detection of HTLV-III antibodies by immunoassay methods. Abs. to these polypeptides are useful as immunoassay reagents for detecting polypeptides in biological specimens, esp. human lymphocytes or human saliva. (Updated on 25-WAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= c

This invention describes a novel recombinant adenovirus comprising an HIV the invention describes a novel recombinant adenovirus elicits an immune response directed against the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparastic, protozoacide, cytostatic and immunoamodulatory activity. The recombinant adenoviruses are useful as waccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria. The immuno-eliminators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-Litrian BHIO antigen construct described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 ATGAGAGTGAAGGAGAAATATCAGCACTTGTGGAGATGGGGGTGGAGATGGGGCACCATG 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.
                                                                                                                           virucide; hepatotropic; RNA editing; GP gene; vaccine; immunity enhanced; infection; influenza; Ebola; Marburg; Arbovirus; hepatitis; respiratory syncytial virus; herpes simplex virus; human papilloma virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing the immunity of a host to infection of a first and second pathogenic virus, e.g. influenza, hepathis, respiratory syncytial, or HIV infections comprises administering to the host a first and a second recombinant adenovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 ATGAGAGTGAAGAGAAAATATCAGCACTTGTGGAGATGGGGGGTGGAGATGGGGCACCATG

(HTLVIII) between bases 5819-6382. The region between bases 37-231 of this sequence (bases 585-605 of the HTLVIII sequence) was amplified region between bases 37-231 of this sequence (bases 585-605 of the HTLVIII sequence) was amplified digested with EcoRI and Khol and ligated with the plasmid pBS-UCU (AAQ87563), also digested with EcoRI and Khol, to generate the asymmetric ribozyme construct p(alpha)Y-R2195 (AAQ87565). The plasmid pBS-UCU is generated by modification of the Helix I box site of plasmid pBS-UCU is the oligonucleotide UCU (AAQ87562). This is an example of an asymmetric ribozyme construct generated to recognise and cleave after the Sequence GUC in the target RNA. The construct encodes the asymmetric xibozyme alpha-Y-R2195 (AAQ87567) which cleaves the HTLVIII RNA sequence AAQ87566. The asymmetric ribozyme generated by transcription of the constructs can be used in treatments to suppress endogenous genes of gathogens or pathogens and pathogens generated by transcriptions of the AB HIV

RESULT

```
The partial sequence of the plasmid pAR6 contg. the human T-cell lymphotrophic virus type III (HTLV-III) bases 5819-6382. The sequence was used to generate an asymmetric ribozyme able to cleave the GTC (GUC in RNA) motif at pos. 230-33. The region between bases 37-231 of this sequence was amplified by the primers AAQ89756-8 and replaced the helix I sequence of construct pSE39-stal2 (AAQ89745). The construct generated (planba)Y-R2195; AAQ89761) encodes the ribozyme (alpha)Y-R2195; AAQ89761) encodes the ribozyme at supermetric ribozyme contg. the catalytic site of a hammerhead ribozyme and a shortened helix I sequence. The ribozymes constructed are asymmetric in that they contain serially deleted Helix I sequences (see AAT05772-80 for other examples). By interchanging the helix I and III sequences, the specificity of the ribozymes can be the seed to inactivate or suppress target RNAs in prokaryote or eukaryote cells such as suppressing certain fruit ripening genes or as protective agents against fungal or insect pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigan, where expression of the HIV antigan by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparasitic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or B or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria. The immunostimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain BH10 antigen construct described in the disclosure of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                              This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparastic, protozoacide, cytostatic and immunoomidatory activity. The recombinant adenoviruses are useful as infection of apathogenic antigen, e.g. HIV, Ebola virus, hepatilis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or useful as genetic vaccines against pathogenic bacteria, parasites or brotozoans, e.g. malaria. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-istrain BH10 antigen construct described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      virucide; hepatotropic; RNA editing; GP gene; vaccine; immunity enhanced; infection; influenza; Ebola; Marburg; Arbovirus; hepatitis; respiratory syncytial virus; herpes simplex virus; human papilloma virus; HIV infection; ds; gene.

The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparasitic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or useful as genetic vaccines against pathogenic bacteria, parasites or protozoansic, e.g. malaria. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-letrain HHU antigen construct described in the disclosure of the
                                                                                                                                                    New recombinant adenoviruses, useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E, or tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 915 BP; 314 A; 168 C; 229 G; 204 T; 0 U; 0 Other;

Enhancing the immunity of a host to infection of a first and second pathogenic virus, e.g. influenza, hepatitis, respiratory syncytial, or HIV infections comprises administering to the host a first and a second recombinant adenovirus.

Example; SEQ ID NO 48; 185pp; English.

The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, bebla, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.

Wang D;

WPI; 2003-182621/18.

New recombinant adenoviruses, useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or B, or tumor antigens.

Claim 17; Fig 48; 156pp; English.

This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparastic, protozoacide, ortostatic and immunomodulatory activity. The recombinant demoviruses are useful as vaccines for eliciting immune response or conferring protection against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepetitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence
infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain BHIO antigen construct described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   virucide; hepatotropic; RNA editing; GP gene; vaccine; immunity enhanced; infection; influenza; Ebola, Marburg; Arbovirus; hepatitis; respiratory syncytial virus; herpes simplex virus; human papilloma virus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The gene can be expressed in simian cells, and synthesis of HIV proteins can be detected immunologically. The recombinant protein product comprises a principal neutralising domain. The neutralising domain is bounded by cysteine residues which occur at positions 296 and 331, the segments between the residues form a loop. See also AAR04427-R04506 and AAQ04273-Q04279. It is a synthetic fragment which encodes a portion of HTLV-III gpl20 envelope protein. It has a blunt end on the 5' end and a CTAG overhang on the non-coding strand at the 3' end which will ligate with BamHI. Used in example to construct pPB1 which is used to express the recombinant HTLV-III fusion protein PB1. PB1 is used to stimulate lymphocyte proliferative response in HTLV-III infected humans. It is suggested that PB1 can be used in the diagnosis, prophylaxis or therapy of AIDS. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 TGTACAAGACCCAACAATACAAGAAAAAGTATCCGTATCCAGAGAGGACCAGGGAGA
                                                      Synthetic polynucleotide encoding HTLV-III gp120 envelope protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant human T-cell leukaemia virus 3 proteins - used for stimulating lymphocyte proliferative response and in diagnosis prophylaxis or therapy of AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 GCATTIGITACAATAGGAAAATAGGAAATATGAGACAAGCACATTGT 108

The recombinant protein product comprises a principal neutralising domain. The neutralising domain is bounded by cysteine residues which occur at positions 296 and 331, the segments between the residues form a loop. See also AAR0427-R04506 and AAQ04273-Q04279. ```
It is an example of a nucleotide sequence coding for a novel protein which is composed of the HIV portion of fusion protein PBI, with or without the N-terminal Met. The novel protein is claimed and so are transfer vectors comprising AAN90740, eg plasmids pdeltaPBI and pd2PBI. BBI is disclosed in EPA 0255190. The novel protein can be used in assays for detecting or quantifying anti-HIV antibody and may be incorporated into vaccine compositions. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       It encodes the HIV portion of HTLV-III fusion protein PB1. PB1 is produced from plasmid pPB1 which contains the HTLV-III env gene from Pvu II - Bg1 II. The protein encoded by this polymucleotide is used to stimulate lymphocyte proliferative response in HTLV-III infected humans.
                            Recombinant HIV proteins - used in assays for detecting and quantifying antibody against HIV and for incorporation into vaccine compsns.
                                                                                                                                                                                                                                                                                                                               1 TGTACAAGACCCAACAACAATACAAGAAAAAGTATCCGTATCCAGAGAGGACCAGGGAGA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fragments of \mbox{HTLV-III} envelope protein - useful in antibody detection vaccines, and new \mbox{DNA} coding sequences.
It is suggested that this protein can be used in the diagnosis, prophylaxis or therapy of AIDS and for the preparation of vaccines against HTLV-III. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PF field.)

```

Recombinant DNA transfer vectors which comprise all or part of the uncleotide sequence or equiv. contg. bases whose translated region codes for the R10, PB1, 590 or KH1 fragments of HTLV-II envelope protein. Host cells transformed with these vectors and HTLV-III envelope protein fragments R10, PB1, 590 and KH1 are claimed. These protein fragments are useful in immunoassays for detection of HTLV-III antibodies; as antignic components of A1DS vaccines; also to stimulate lymphocyte proliferative response in infected individuals. (Updated on 25-MAR-2003 to correct PA 2003 to corre

The HIV portion of PBI is used to stimulate lymphocyte proliferative response in HTLV-III infected humans. It is suggested that the HIV portion can be used in the diagnosis, prophylaxis or therapy of AIDS and for the preparation of vaccines against HTLV-III. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PP field.)

                                                                                                                                                                                                                                                                                                                                                                                           The DNA sequence contains essentially the HIV env gene from the PvuII site to BgIII site and encodes a novel recombinant HIV envelope protein, PBI. This plasmid in a suitable host, E. coli, can be used to produce the HIV 26kD fusion protein PBI. The protein can be used in diagnosis (in immunochemical assays, as an immuno- adsorbant), prophylaxis (a vaccine) or therapy of AIDS. Fragments of PBI can be used to stimulate a lymphocyte prolliferative response in HIV-infected humans. This would then stimulate the immune system to respond to HIV. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PP
```

```
It is a synthetic fragment which encodes a portion of HTLV-III gpl60 envelope protein. It has a blunt end on the 5' end and a TCGA overhang on the mon-coding strand at the 3' end which will ligate with HindlII. Used in example to construct p590 which is used to express recombinant HTLV-III fusion protein 590. 590 is used to stimulate lymphocyte proliferative response in HTLV-III infected humans. It is suggested that 590 can be used in the diagnosis, prophylaxis or therapy of AIDS. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human immunodeficiency virus
```

ó

```
It is an example of a nucleotide sequence coding for a novel protein which is composed of the HIV portion of fusion protein 590, with or without the N-terminal Met. The novel protein is claimed and so are transfer vectors comprising AAN9740, eg plasmids pdeltarB1 and pd22P1. 590 is disclosed in EPA 0255190. The novel protein can be used in assays for detecting or quantifying anti-HIV antibody and may be incorporated into vaccine compositions. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                     Recombinant HIV proteins - used in assays for detecting and quantifying antibody against HIV and for incorporation into vaccine compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 1059;

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Original source text: Human immunodeficiency virus type 1 (HIV-1) proviral DNA clone BH10.

[(in) Weiss_R.Y. Teich, N., Varmus, H. and Coffin, J. (Eds.); RNA Tumor Viruses, Molecul review; bases 1 to 8932.

The BH10 sequence differs from BH8 and BH5 by 0.9% in the coding regions and 1.8% in the noncoding regions, and the authors of [1] believe that these are stable variants.

The HTLV-III genome encodes at least seven proteins: gag, pol, env, tat, trs, 27% antigen and the sor 23% product. The 3' ORF (positions 8153-873) is truncated in BH10 (stop codon at positions 8522-8524), but reads through in BH8 and other sequences to yield what is now called the 27% antigen.

The mechanism for pol gene translation has not been elucidated: a gag-pol fusion protein is possible, splicing or frameshift have not been ruled out. The viral protease would be determined by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  region in question.

The Tat protein (trans-activator protein, approximately 14 kb) is an effector of an autostimulatory pathway through interaction with a positive control element, the trans-activating responsive sequence. TAR. Tat seems to be a transcriptional control molecule in HTLV-I, but is both that and a post-transcriptional regulatory molecule in HTLV-III. Deletion mutants in the tat gene are incapable of prolific replication and exhibit no cytopathic effects in T4+ cell lines.

In addition to the addition to th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hostomsky, Z., Hostomska, Z., Hudson, G.O., Moomaw, E.W. and Nodes, B.R.
